

Water cycle 100 word read

The water cycle is how water moves from the ground to the sky and back again. It starts when the sun heats up water in rivers, oceans, and lakes, causing it to turn into water vapor or steam. This water vapor rises up into the sky and forms clouds. When the clouds get heavy with water, the water falls back down to the ground as rain, snow, sleet, or hail. The water that falls to the ground can be soaked up by plants, run off into rivers and lakes, or go underground to become part of the groundwater supply. The water cycle is an important process that helps to keep our planet hydrated and healthy.

What is the water cycle?

How does the sun do to the water?

What happens to water vapor in the sky?

What are some forms of precipitation?

Why is the water cycle important for our planet?
